Connector helps prevent elbow overheating

Elbow overheating is a common but unnecessary problem you can put behind you once and for all. The solution is the HUBBELL® PROBELOK® Connector.

Conventional elbows use simple threaded connections between the cable connector and probe. When a lineman has to twist an elbow to put it on or pull it off, the connection loosens and creates a wobble. That wobble creates a hot spot that can cause elbow overheating and failure. One service call can cost hundreds of dollars. The PROBELOK Connector Elbow is the solution. It has a special insert that holds the threaded connection tight, even if flexing causes it to turn.

Protection against connector overheating is quick and easy with HUBBELL PROBELOK Connector Elbows.

*Make HUBBELL Elbows with
PROBELOK connectors the way
to cut repair costs and keep
your elbow's COOL.*
